

WAIT TIME COLLECTION METHODS

A symbol displayed below a border crossing indicates the type of methodology used for wait time estimation.

Bluetooth - This symbol indicates wait time measures for the crossing are being calculated using

Bluetooth®-based technology. Bluetooth® readers capture wireless signals emitted from a travelers

Bluetooth® device (e.g., cellphones, tablets, laptops) as the vehicle approaches the border. The

Bluetooth® signals are then used to determine an estimated wait time.

NOTE – All other crossings use a manual wait time collection method such as line of sight and/or driver surveys.
